AutoCAD is frequently bundled with Autodesk's software for the graphic design and construction of structures. In addition, AutoCAD is the industry standard for 2D construction drawings. Using AutoCAD, architects and engineers can view, manipulate, annotate, and share design data in both 2D and 3D views, as well as review and annotate 2D plans or sections. You can also use the Map Options to place the drawing on a map. The current AutoCAD suite includes AutoCAD LT, AutoCAD Classic, AutoCAD MFD, AutoCAD WS, and AutoCAD Map 3D. AutoCAD LT (at the time of writing) is a stripped-down version of the full-featured version. It is intended for use in the classroom. AutoCAD Classic, AutoCAD MFD, and AutoCAD WS are three commercial versions of the software that are built on top of AutoCAD LT. Additionally, Autodesk has released some free and open source versions of AutoCAD that use the same underlying technology. These are similar to the commercial versions but allow for more users. This article explains how to open and close a drawing in AutoCAD, how to navigate and manipulate objects in a drawing, how to annotate drawings, and how to save drawings in different formats.

How to open a drawing in AutoCAD You can open a drawing in AutoCAD in two ways: from the program's menu, or from the File menu.

How to navigate and manipulate objects in a drawing You can navigate around the drawing in either the Navigator mode or the View mode. To switch between Navigator and View mode, press Esc on the keyboard. The main panels will change to reflect the chosen mode, and you can close the panels and return to Navigator mode by pressing Esc again. When you open a new drawing, you are in View mode. You can navigate in different ways, depending on your preference. You can use the standard methods:

- Zooming in and out
- Changing the horizontal and vertical position of the display

How to annotate drawings Annotate drawings by using one of the standard annotation tools, which include:

- Cross-hairs
- Numeric text tool
- Horizontal and vertical text lines
- Paint
- Simple line
- Ellipse

A major problem for many manufacturers of a wide variety of products, including metal products, such as sheets, pipes, structural beams, etc., is how to enhance their products with features that permit their products to be used in a wide variety of different applications. Such enhancements may include, for example, drilling, forming and/or embossing holes in such products. In particular, for those products that are typically made from sheets or strips of materials that are then formed or bent into pipes, trusses, beams, structural members, or other shapes, such as parts of wind turbine blades, it is desirable to drill or otherwise form the product so that the resulting products have a higher load-bearing capacity, or so that the products can be more easily connected. It is also desirable that such products can be used in a variety of ways and in many different applications. For example, it may be desirable to allow the products to be used in many different applications with or without additional components, or to allow the products to be used in applications that are more cost-effective, such as applications in which only a small number of products are needed, but where the products must have a high load-bearing capacity. In particular, it is desirable to provide a variety of products that have enhanced load-bearing capacities for use in wind turbine applications, and to do so in a cost-effective manner, so that the costs of the products are amortized over the entire life of the products, and not increased by the addition of features that add weight to the products. In particular, it is desirable to
