We present observations of the trailing acoustic wake of a cylindrical jet of aqueous glycerol solution flowing from a pressurized reservoir. This type of jet is distinguished from those studied previously by being generated with a large aspect ratio, by being self-similarly scaled in the transverse direction, and by being longer in the axial direction. A self-similarly scaled cylindrical jet and the flow within its main body are demonstrated to provide a model for the in-flow of the main body. The observed scaling behaviors are explained by considering the effects of gravity, internal acoustic waves, and the jet-induced shear flows on the internal structure of the jet. The hydrodynamic and acoustic forces acting on the fluid are calculated using direct numerical simulations.is (1%--3%) [@pone.0086875-Sreekumar1]. In contrast to those studies which reported that dental students are at risk of developing chronic periodontitis, our study did not find that these students were more likely to develop chronic periodontitis. A previous study in Brazil also did not find a significant increase in the prevalence of chronic periodontitis in a university dental student population when compared to the general population of Brazil [@pone.0086875-Hida1]. The students who reported poorer oral hygiene practices were more likely to have increased attachment loss and pocket depths. While poor oral hygiene practices may lead to the development of periodontitis, it is also

well-established that a history of gingivitis is a key risk factor for the development of periodontitis [pone.0086875-Ramjim1]. Thus, our results support the hypothesis that poor oral hygiene practices may be a more important risk factor for a1d647c40b

Note: the installed version may be less than the version on the website, because of the differences in the version number and in the installation. After activation, go to Autodesk, Autocad, Maintenance or Autocad Online (the "Application" menu is in the main menu) and click Maintenance. If this is a trial version, then it will not appear. If you want to activate an older trial version, you need to deactivate the trial version and purchase the product. In Autodesk Autocad, under "Administration", click "Tools" and then "Maintenance". A window appears in which you can either choose to deactivate or activate Autodesk Autocad. After this you can activate your product. Conventionally, there have been known fuel tanks that are attached to fuel feeding devices, such as fuel tanks mounted on a chassis or on a side wall of a vehicle. For example, PTL 1 discloses a configuration in which a fuel tank is attached to a vehicle chassis at a location near a tank attachment flange, a tank lid is disposed at a location close to the fuel tank, and a fuel feeding device is disposed at a location far from the tank lid. In this configuration, when the fuel tank is detached from the vehicle chassis, the fuel feeding device is detached from the vehicle chassis in advance. Further, a feed-back pipe is coupled to a fuel feeding pipe (fuel path) of the fuel feeding device, and the fuel feeding device is detached from the feed-back pipe. Accordingly, the fuel feeding device is easily detached from the fuel tank. Why do we sometimes change our minds? Is there more to it than simple reasoning? I'm an experimental psychologist studying decision-making and rational choice. A project of mine looks at how biases in perception lead to distortions in our decision-making. I don't have a good answer yet for why we are "error prone" in these decision-making processes. Is there a more fundamental reason for this than merely an effect of training, experience, and so on? What I find most interesting is how quickly people alter their view of the world. Even a year after a scientific article is published, only half of people believe it, and the vast majority of these are people with expertise in the relevant fields. To me this suggests that our perception of reality is constantly in flux; the world is not as we perceive it, but rather that the
