Chalkspiration

Chalkspiration is the way to go if you are into chalkboard art. This application enables you to transform your photos into a beautiful chalky outline, while paying close attention to detail and not forgetting about shading and lighting. Chalkboard art templates To make things easier, Chalkspiration comes with a generous collection of templates that you can use to obtain the desired effect. The good thing about Chalkspiration is that it can automatically adjust the size of the input photo to fit perfectly with the selected template, making it very easy to use. There are a few additional settings you can tamper with, such as the border color, width and corner style, the blackboard strength (which is actually the dusty background that makes the canvas look like a blackboard) and of course, the chalkboard color. You can also experiment with different chalk colors and modify the shade strength or style, as well as the outline details. Every modification you make to these parameters is immediately rendered in the preview area, so that you can make adjustments as you go. Photo editing options and a rich object library If you are not satisfied with the predefined templates, you can also start drawing on top of a loaded photo using brushes. With just a few clicks, images or individual objects can be moved, resized, rotated, cropped, flipped, deleted or duplicated. The built-in library includes various types of beautifully-designed objects such as banners, flourishes, texts and embellishments. You can combine them with one or more photos from your computer to create a great-looking collage. Create chalk artwork out of your photos If you like chalk artwork then you should definitely give Chalkspiration a try. Thanks to the rich collection of templates and the variate object library, working with it to create your own design for home or office is a breeze. Not only does it transform your photo into a chalk outline, but takes into consideration light shading and the background appearance, so as to obtain impressive results. [Read More][Use of fleroxacin in the treatment of patients with community-acquired respiratory tract infections in the outpatient clinical setting]. We evaluated the efficacy of a single oral dose of fleroxacin (FLX; 200 mg) in the treatment of 226 patients with community-acquired infections in outpatient clinical setting. The study was performed during the period November 1991-June 1992 and included patients with non-complicated infections of the lower respiratory tract (pneumonia), sinusitis and pharyngitis. The diagnosis of pneumonia was based on clinical, laboratory and radiographic data. The patients treated with FLX were classified according to the criteria of the European Organization for Research and Treatment of Cancer (EORTC). Most of the patients (100%) achieved resolution of the clinical symptoms within 4 days. The EORTC overall response rate was 81.2%. By EORTC criteria, 71.3% of the patients had a favourable response and 22.3% a poor response. The percentage of patients with an excellent or good response was similar in patients with pneumonia (77.5%) and sinusitis (83.3%) or pharyngitis (73.3%). The cure rate was the same for pneumonia (59.6%) and sinusitis (59.1%) or pharyngitis (64.3%) with no significant differences between these conditions. The bacteriological response in patients with pneumonia was 78.6%, for sinusitis, 80.8% and for pharyngitis, 78.8%. In patients with pyogenic infections in the upper respiratory tract, FLX was effective against the predominant pathogen isolated. In patients with a poor clinical response the use of FLX after 7 days of therapy allowed to identify the microorganism responsible for the infection and to start adequate antibiotic treatment. Microbially Induced Carbonates for Hydrogen Storage. The growing demand for clean energy supplies calls for the development of advanced hydrogen storage technologies. While all the known hydrogen storage materials are metals, hydrotalcites are nonmetals, and contain a large amount of carbonate groups that can easily decompose to release hydrogen. In this work, we show that the incorporation of anionic PbCO_3 into a Pb/C mixed oxide results in a composite with a high hydrogen storage capacity and excellent rate capability, which is comparable to those of advanced hydrogen storage materials. The rate capability and capacity is further improved by incorporating CaCO_3 into the Pb/C mixed oxide. By understanding the reaction pathways for carbonation and decomposition processes, it is demonstrated that carbonation is the rate-limiting step and PbCO_3 is the active species that triggers the reaction. This study provides a feasible and cost-effective route for developing high-performance, carbon-containing hydrogen storage materials, and also provides an alternative carbon source for hydrogen-storage material production.
