DOWNLOAD .Q: What is the dual of integral and what are the properties of its dual? Let \mathcal{C} be a category. Consider the category \mathcal{C}^{op} which has the same objects as \mathcal{C} but in which the morphisms are reversed. Now let \mathcal{C} be a category with finite products and let $F: \mathcal{C} \rightarrow \mathbf{Set}$ be a functor preserving products. By taking the presheaf topos, $\text{Sh}(\mathcal{C}, \mathbf{Set})$, we have the topos $\text{Sh}(\mathcal{C}, \mathbf{Set})^{\text{op}}$ where the presheaves are now reversed. Now we can also take the dual of this topos. In my example, the topos is $\text{Sh}(\mathcal{C}, \mathbf{Set})^{\text{op}}$. The question is now: Is there a duality between the category \mathcal{C} and its opposite and what is the dual of an integral? A: What is the dual of a presheaf? The left adjoint of a presheaf F is the right adjoint of the presheaf $\text{hom}(-, F)$. I'm not sure if this is the notation you're looking for, but I'll use it as the generic notation. This is to avoid confusion with the standard notation. That is, the left adjoint is F^{ast} , where $F^{\text{ast}}(X) = \text{hom}(F(X), I)$ where I is a representing object for the initial topos. Likewise, the left adjoint of a sheaf is the right adjoint of the sheaf $\text{hom}(-, F)$. We have $F_*(X) = \text{hom}(F(X), I)$ where I is a representing object for the final topos. The left adjoint to a sheaf is the sheaf whose
