From The First Drug War to our modern war on drugs, we explore the history of. when the U.S. was in a panic over heroin and opium addiction. The Marihuana Tax Act of 1937, which imposed. Fossil fuel (hydrocarbons) contain

---

impurities that can potentially harm the environment and human health if released into the atmosphere. These impurities include sulphur compounds and mercury. The amount of mercaptans released depends on the operating conditions of the coal plant. The rate of release also depends on the type of coal, the plant design, and the exact nature of the coal seams. Fossil fuels are burnt in a number of ways to produce electricity. The coal is generally burnt in a boiler or a furnace. These installations, commonly referred to as 'boilers' can be, for example, steam boilers, combined cycle boilers or gas and steam boilers. The vapour produced

---

by the fuel being burnt is then led through several pipes to the turbines where the high pressure gas is expanded. The expanded gas then rotates the turbine shaft. Power is therefore transferred to the generator. The vapour stream that is given off during the high temperature combustion of the coal in the boiler is normally cooled by an absorber tower. In an absorber tower, the vapour is brought into contact with a refrigerant to absorb sulphur compounds and mercaptans. The sulphur compounds and mercaptans are then subsequently condensed in the cooling air stream and are then disposed of in the system that would normally have disposed

---

of sulphur compounds and mercaptans. The decomposition of hydrogen sulphide and mercaptan impurities in the cooling air stream releases to the atmosphere gases that are known as sulphur compounds. These sulphur compounds are known to cause acid rain. It is therefore desirable to minimise the
