Aids you in the journey of enhancing your computer's performance Aids you in the journey of enhancing your computer's performance Editor's note: Engadget has updated this review to reflect that the version of Pocket Killbox that came with our review unit is now updated to version 2.0, which fixes a few bugs. The original version of Pocket Killbox is a Mac application that's supposed to help you wipe your computer clean. It's similar to the built-in erase utility that comes with OS X, but offers additional controls and allows you to kill processes as well. If you need to remove something from your Mac or get rid of an old partition, Pocket Killbox could be your best friend. Unfortunately, there's a problem with the Mac version of the app, though. When you attempt to delete a file in the OS X Finder, it brings up the "Are you sure you want to delete?" warning and won't allow you to proceed. The same happens in Windows Explorer. To work around this issue, Pocket Killbox for Mac creates a dummy file when you try to delete a real file -- and also makes a backup of it. It works just fine in Windows Explorer, but if you try to delete a real file, Windows itself will prompt you with the "Are you sure you want to delete?" warning. There's no need to use the app, though, because you can delete files or partitions on your Mac or Windows computer using the built-in tools included with those platforms. The problem is, neither tool gives you the granular control that Pocket Killbox gives you. There are a number of privacy-related reasons why some people want to clean their PC of old crap, or increase their available storage. Is that you? Does your Mac or PC have things you don't want on it anymore, and you don't know where to start? Then Pocket Killbox is the tool you need. Pocket Killbox is a free PC clean-up utility that is designed to be a data shredder and a tool that lets you erase files and folders from your computer. The utility lets you erase files and folders using three different methods: ✓ Standard delete: Erases the file/folder and everything inside the folder. ✓ Reboot delete: Erases the file/folder and everything inside the folder. The file/folder is still on the system, but it's inaccessible to users. This is a good choice for those who want to delete files/folders but still want the system to remain operational. ✓ Replace on reboot: Overwrites the original file with a new one. After the reboot, the new file will replace the deleted one. The original file will be deleted when the new one becomes accessible. Note that if the file/folder is encrypted, this option will not work. There are also a few extra options such as: ✓ Replace on reboot with alternate file: Overwrites the original file with a new one. After the reboot, the new file will replace the deleted one, but the old one will be left on the system. ✓ Erase contents on reboot: Erases all contents of the file/folder and everything inside the folder. ✓ User-defined reboot schedule: Lets you customize the folders you want to delete when the computer is restarted. ✓ Process monitoring: Monitors and kills all running processes. ✓ Session manager: Opens the window that lets you restore Windows to the last fully functional session. ✓ Hosts editor: Opens the window that lets you edit your hosts files. ✓ Tools: Opens the tools menu with shortcuts to Session Manager and the hosts file. ✓ About: Displays the program's version and copyright. ✓ Screenshots: Displays screenshots of the program's interface. ✓ Support section: Displays the program's support section.
